Emission Levels by traffic condition

KEY INSIGHTS

- High traffic conditions show the highest vehicle count.
- Higher traffic is associated with higher emission levels.
- Ride-sharing demand remains around 50 across traffic conditions.
- Lower parking availability can increase mobility pressure.
- High occupancy + low speed identifies potential congestion anomalies.
- Improving traffic flow and parking availability can support better urban mobility.

Key Insights & Recommendations

- High occupancy with low traffic speed indicates potential congestion hotspots.
- Increased ride-sharing demand can add pressure to already congested roads.
- Improve parking availability and traffic flow management in high-demand areas.
- Use anomaly monitoring to identify unusual traffic conditions early.
- Prioritize mobility improvements in areas with lower Mobility Access Index.
